

Data Management

Since its inception, the EUDAT project has been working with various European research communities to identify the types of services that researchers commonly need for handling research data and then developing the most relevant of those services. EUDAT is currently offering a range of services through its CDI nodes, and is also in the process of developing further useful services. The services that end users see can be divided into four main areas as follows:

- [Data Access & Reuse](#)
- [Data Preservation](#)
- [Data processing and analysis](#)
- [Sensitive Data Management](#)
