## B2Safe @ ODC and future EIDA/ EPOS-S plans within EUDAT2020

Luca Trani and the EIDA Team  
Acknowledgements to SURFsara and the B2SAFE team

 3rd **EUDAT** Conference, Amsterdam, The  
Netherlands, 24-25 September 2014

# Outline

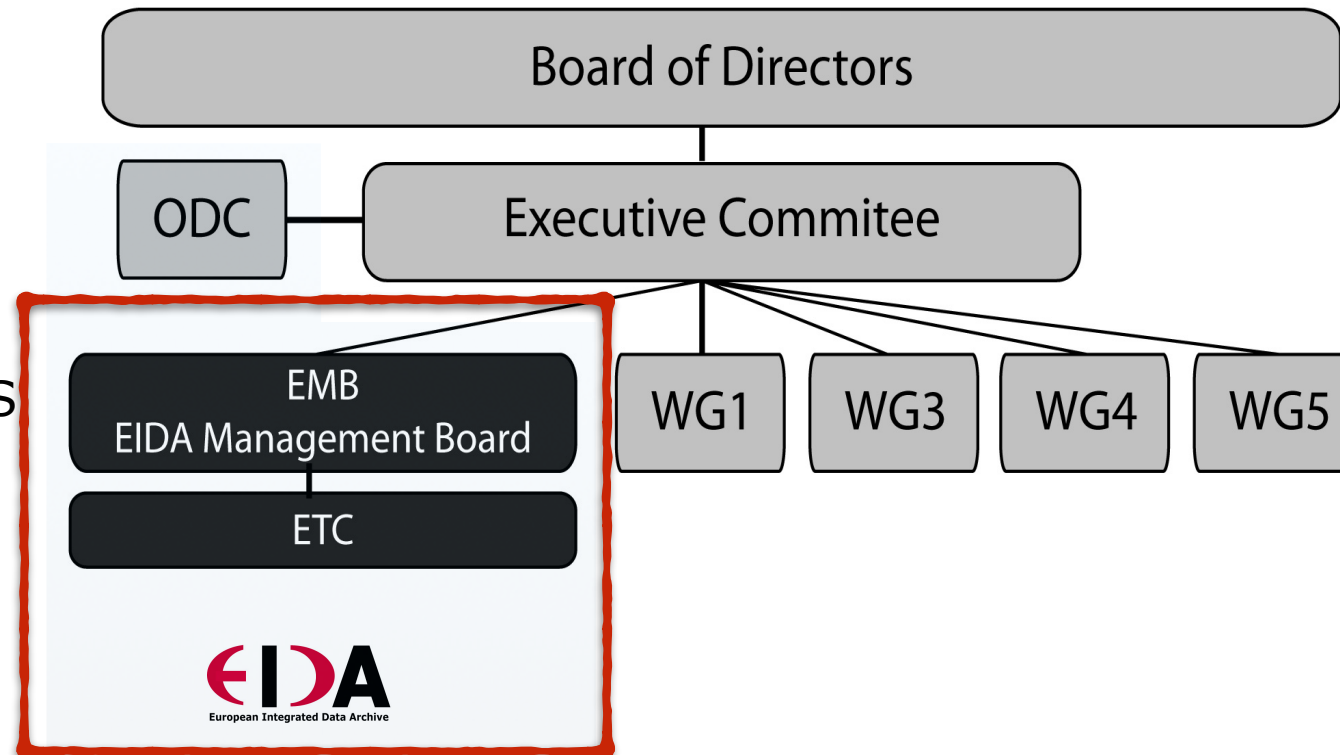

- ORFEUS
- European Integrated Data Archives concept
- ORFEUS Data Center
- Why B2SAFE and description of the implemented solution
- Current limitations
- EIDA/EPOS-S future plans within EUDAT2020

# ORFEUS

ORFEUS (Observatories and Research Facilities for European Seismology), is the non-profit foundation that aims at co-ordinating and promoting digital, broadband (BB) seismology in the European-Mediterranean area. It was founded in 1987 by corporate founders from 13 European countries forming the board of directors. Its activities are distributed between the ORFEUS Data Centre (ODC), gathering, archiving and providing waveform data, and four working groups, coordinating data availability and relevant developments.

## Orfeus

EIDA since Nov 2012  
officially under ORFEUS

### EIDA GOALS

- **safe, persistent** archival and dissemination of **high quality** seismic waveforms and products via **distributed archives**
- easy access for scientists - support multiple access methods, standards and tools
- open, where possible, but also closed / restricted access
- provide best datasets available

# EIDA today

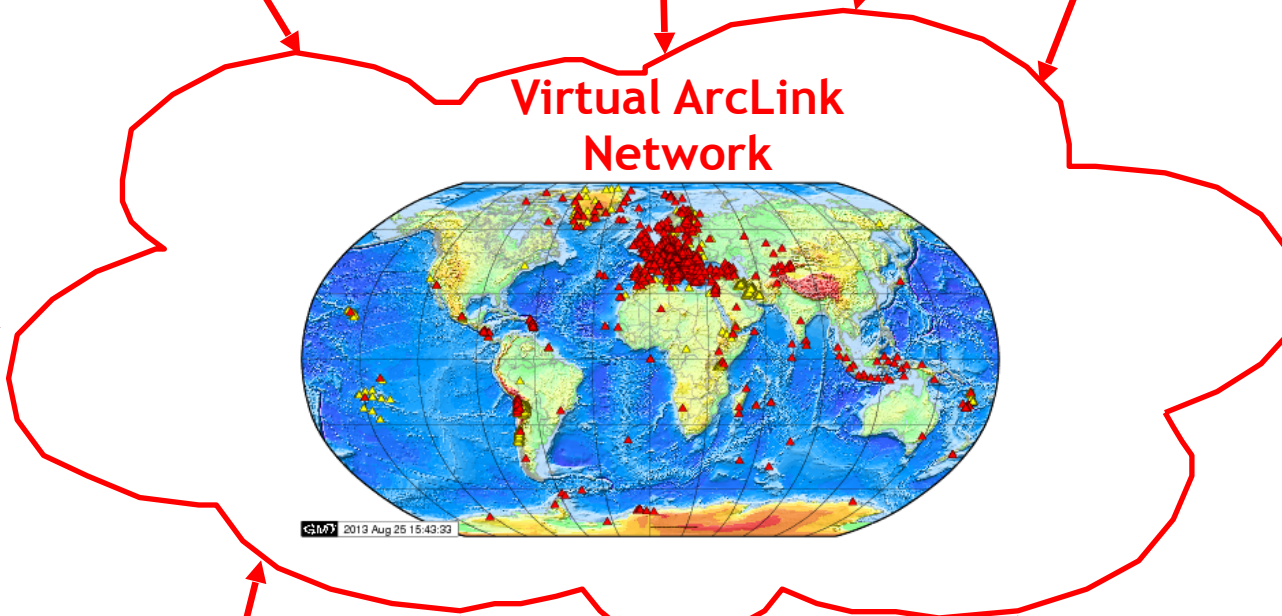

# EIDA

Users: Geoscientists  
etc...

web portals  
arclink\_fetch  
obsPy.arclink

web services  
breq\_fast  
SeisComP3  
other tools...

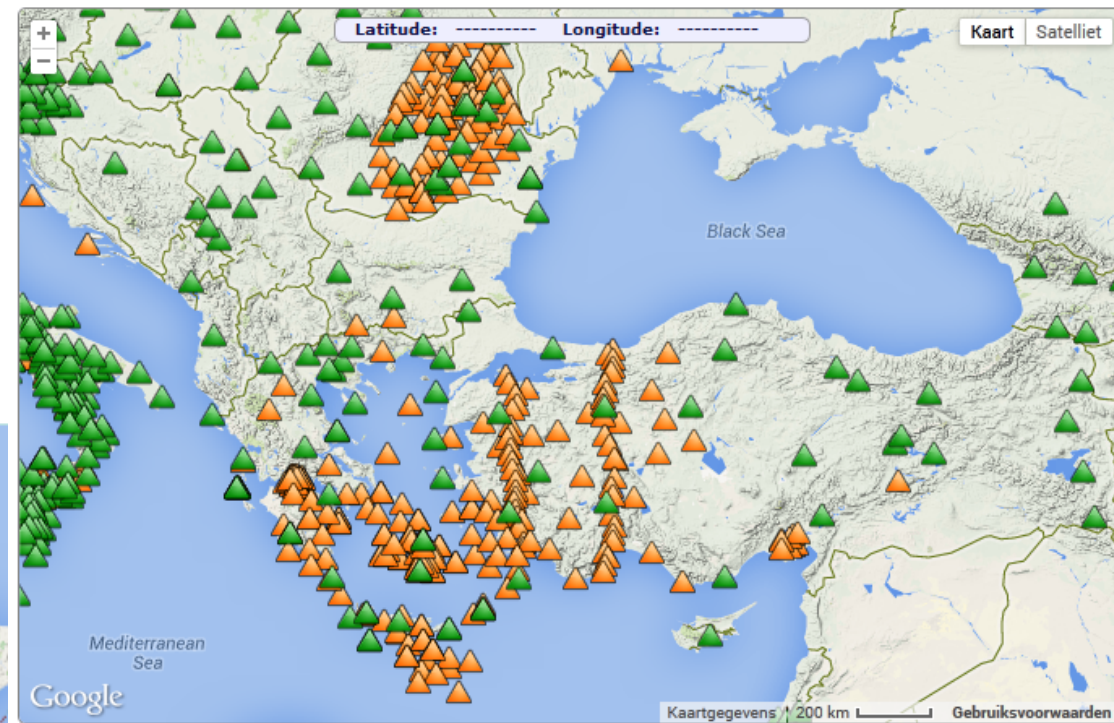

# EIDA in numbers

EIDA currently provides uniform, unrestricted and rapid access to about **~400 TB** of data

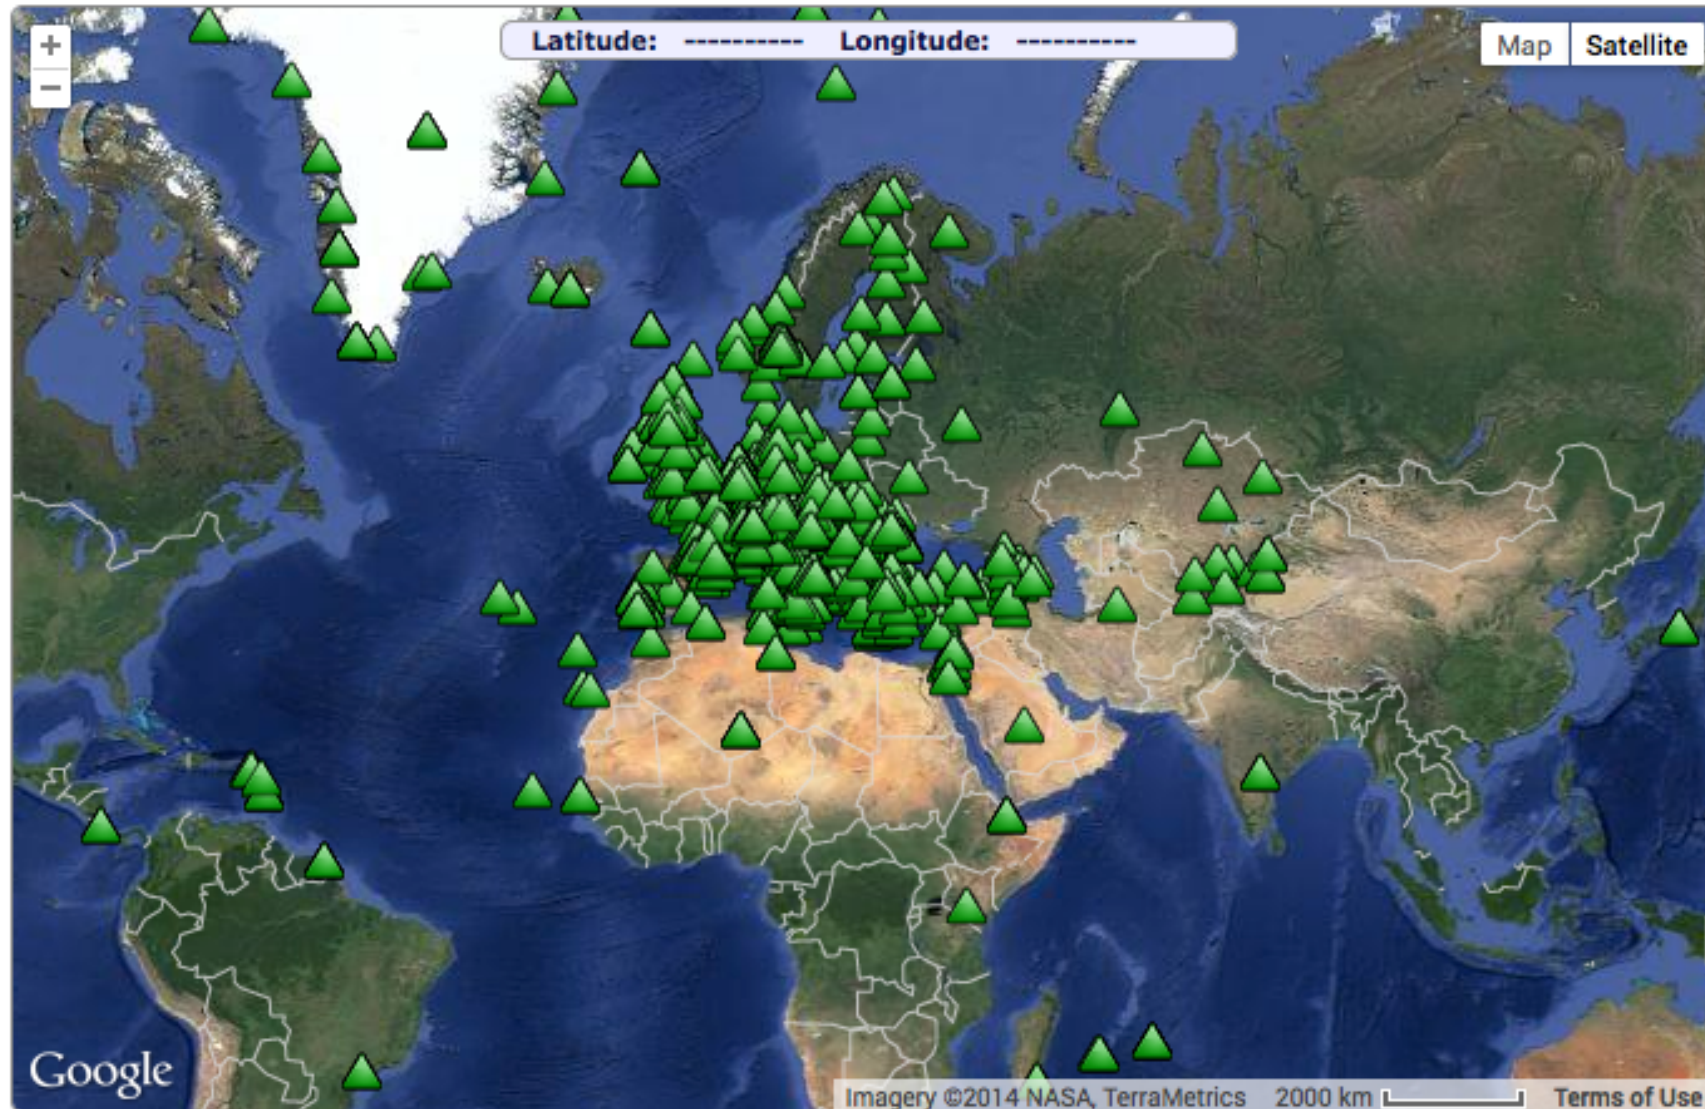

- **80** permanent networks
- **58** temporary networks
- **4500** open access stations
- **1600** real-time permanent stations
- **25-50** GB downloads per day

Permanent station  
Temporary station  
EIDA node

# ORFEUS Data Center

The Orfeus Data Center (ODC) acts as regional data centre within the International Federation of Digital Seismograph Networks (FDSN) and is hosted by the seismological division of the KNMI in The Netherlands

The VEBSN (Virtual European Broadband Seismograph Station Network) is the pool of broadband seismographs from which data is shared in real-time with ORFEUS Data Center

The centralised archive contains waveform data from 1988 to present, from about 60 networks

# ODC: waveform data

Continuous waveforms data growth from 1988

# Seismic continuous waveform

Seismic stations continuously record ground motion and send their data in real time to data centers which collect them

Each station is equipped with different sensors: typically targeting different spatial and frequency components

Data are usually stored as binary files encoded in a standard format called SEED (Standard for the Exchange of Earthquake Data) or better MSEED (its compact version)

A common convention is to arrange data in daily files divided per network, station, channel, location code

E.g.: SABA.HHE.NA.2014.001, SABA.HHN.NA.2014.001, SABA.HHZ.NA.2014.001

## Why B2SAFE

Orfeus mission:

*"Provide safe, persistent and long term archival and preservation of high quality waveform data"*

It matches perfectly with the features offered by B2SAFE

Moreover it allows full control on the choice of data replication facility vs generic cloud service => very important for computation

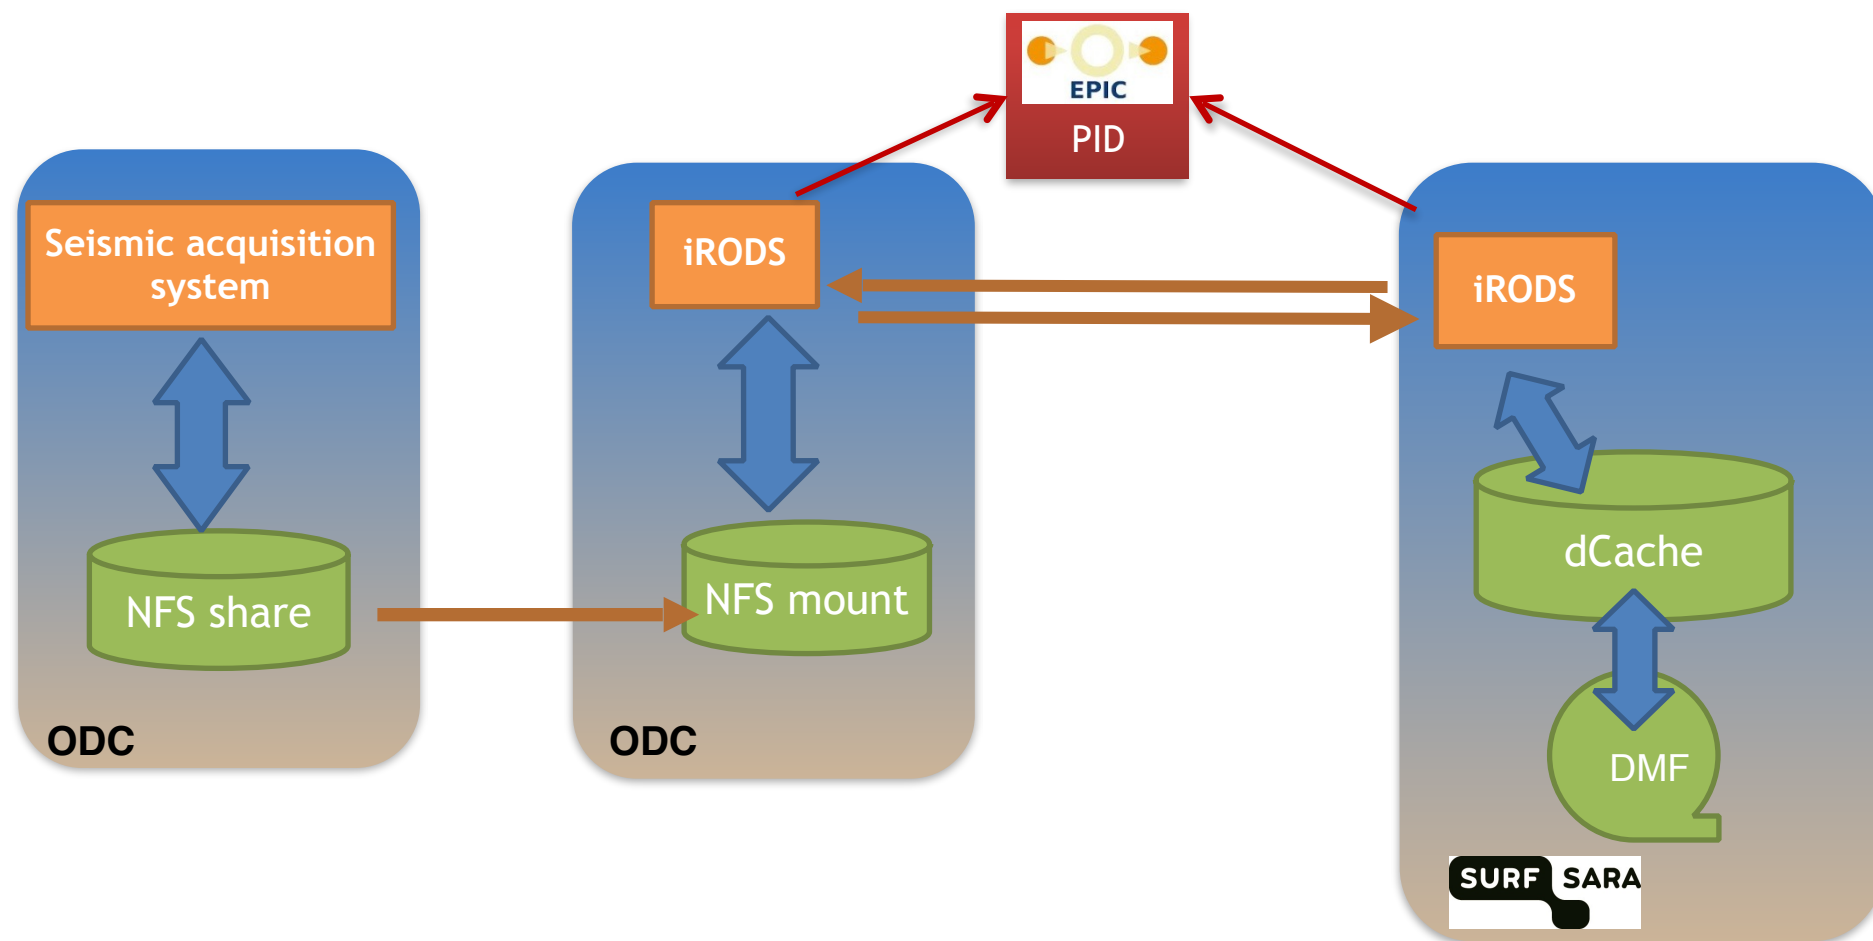

Possibility to implement customised rules and data workflows

## Solution: overview

Main components:

- iRODS: micro services utilised to create customisable replication rules
- EPIC handle system: PID minting and management

Thanks to Robert Verkerk

## Solution: workflow

- 1) Register dataset in iRODS (locally at KNMI): ireg...
- 2) Generate PID at KNMI
- 3) Replicate dataset to SURFsara
- 4) Generate PID of the replica at SURFsara
- 5) Update parent PID with replica information at KNMI

# Solution: PIDs

## Solution: some numbers

- Replication of the ODC archive from 1988 to Dec 2013 completed ~ 6.6 M files
- Registration of the first 6 months of 2014 into iRODS at KNMI ~800.000 files
- Registration rate in iRODS ~100.000 files per day
- Replication rate ~ 80.000 files per day  
(Typical file size range: from a few KB up to 20-30MB)

### **Planned actions:**

- Finalise replication up to current day
- Set up an automatic procedure to register and replicate new files

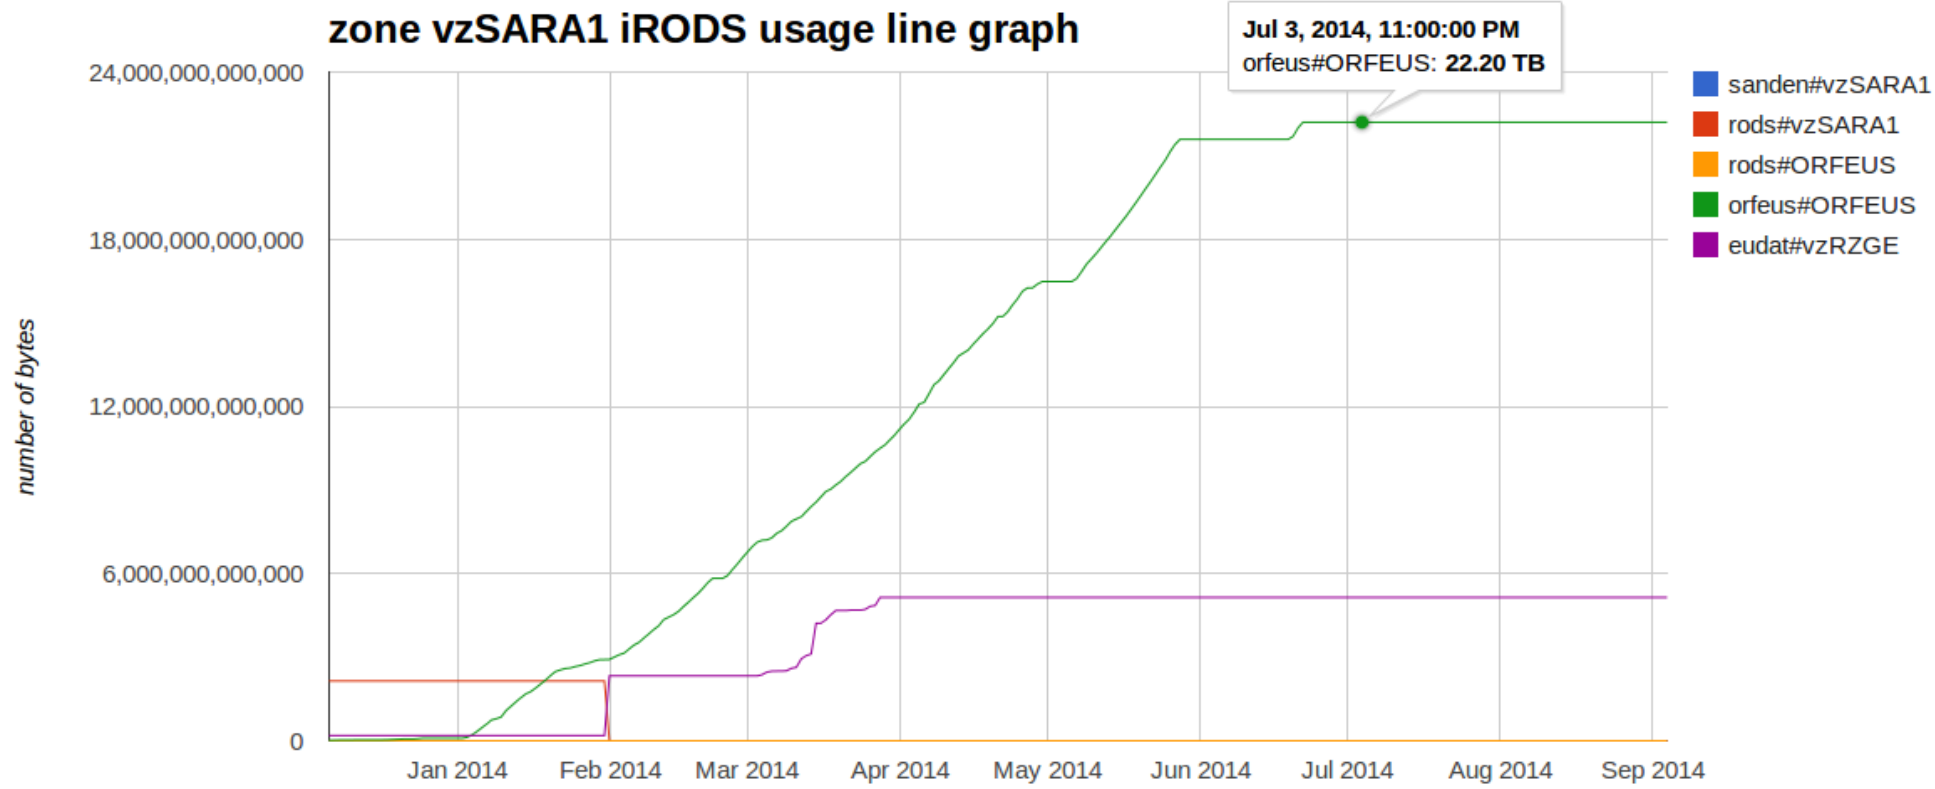

# EPIC usage in handles

## epic4\_master\_surfsara\_11225\_usage usage line graph

# iRODS usage in bytes

## zone vzSARA1 iRODS usage line graph

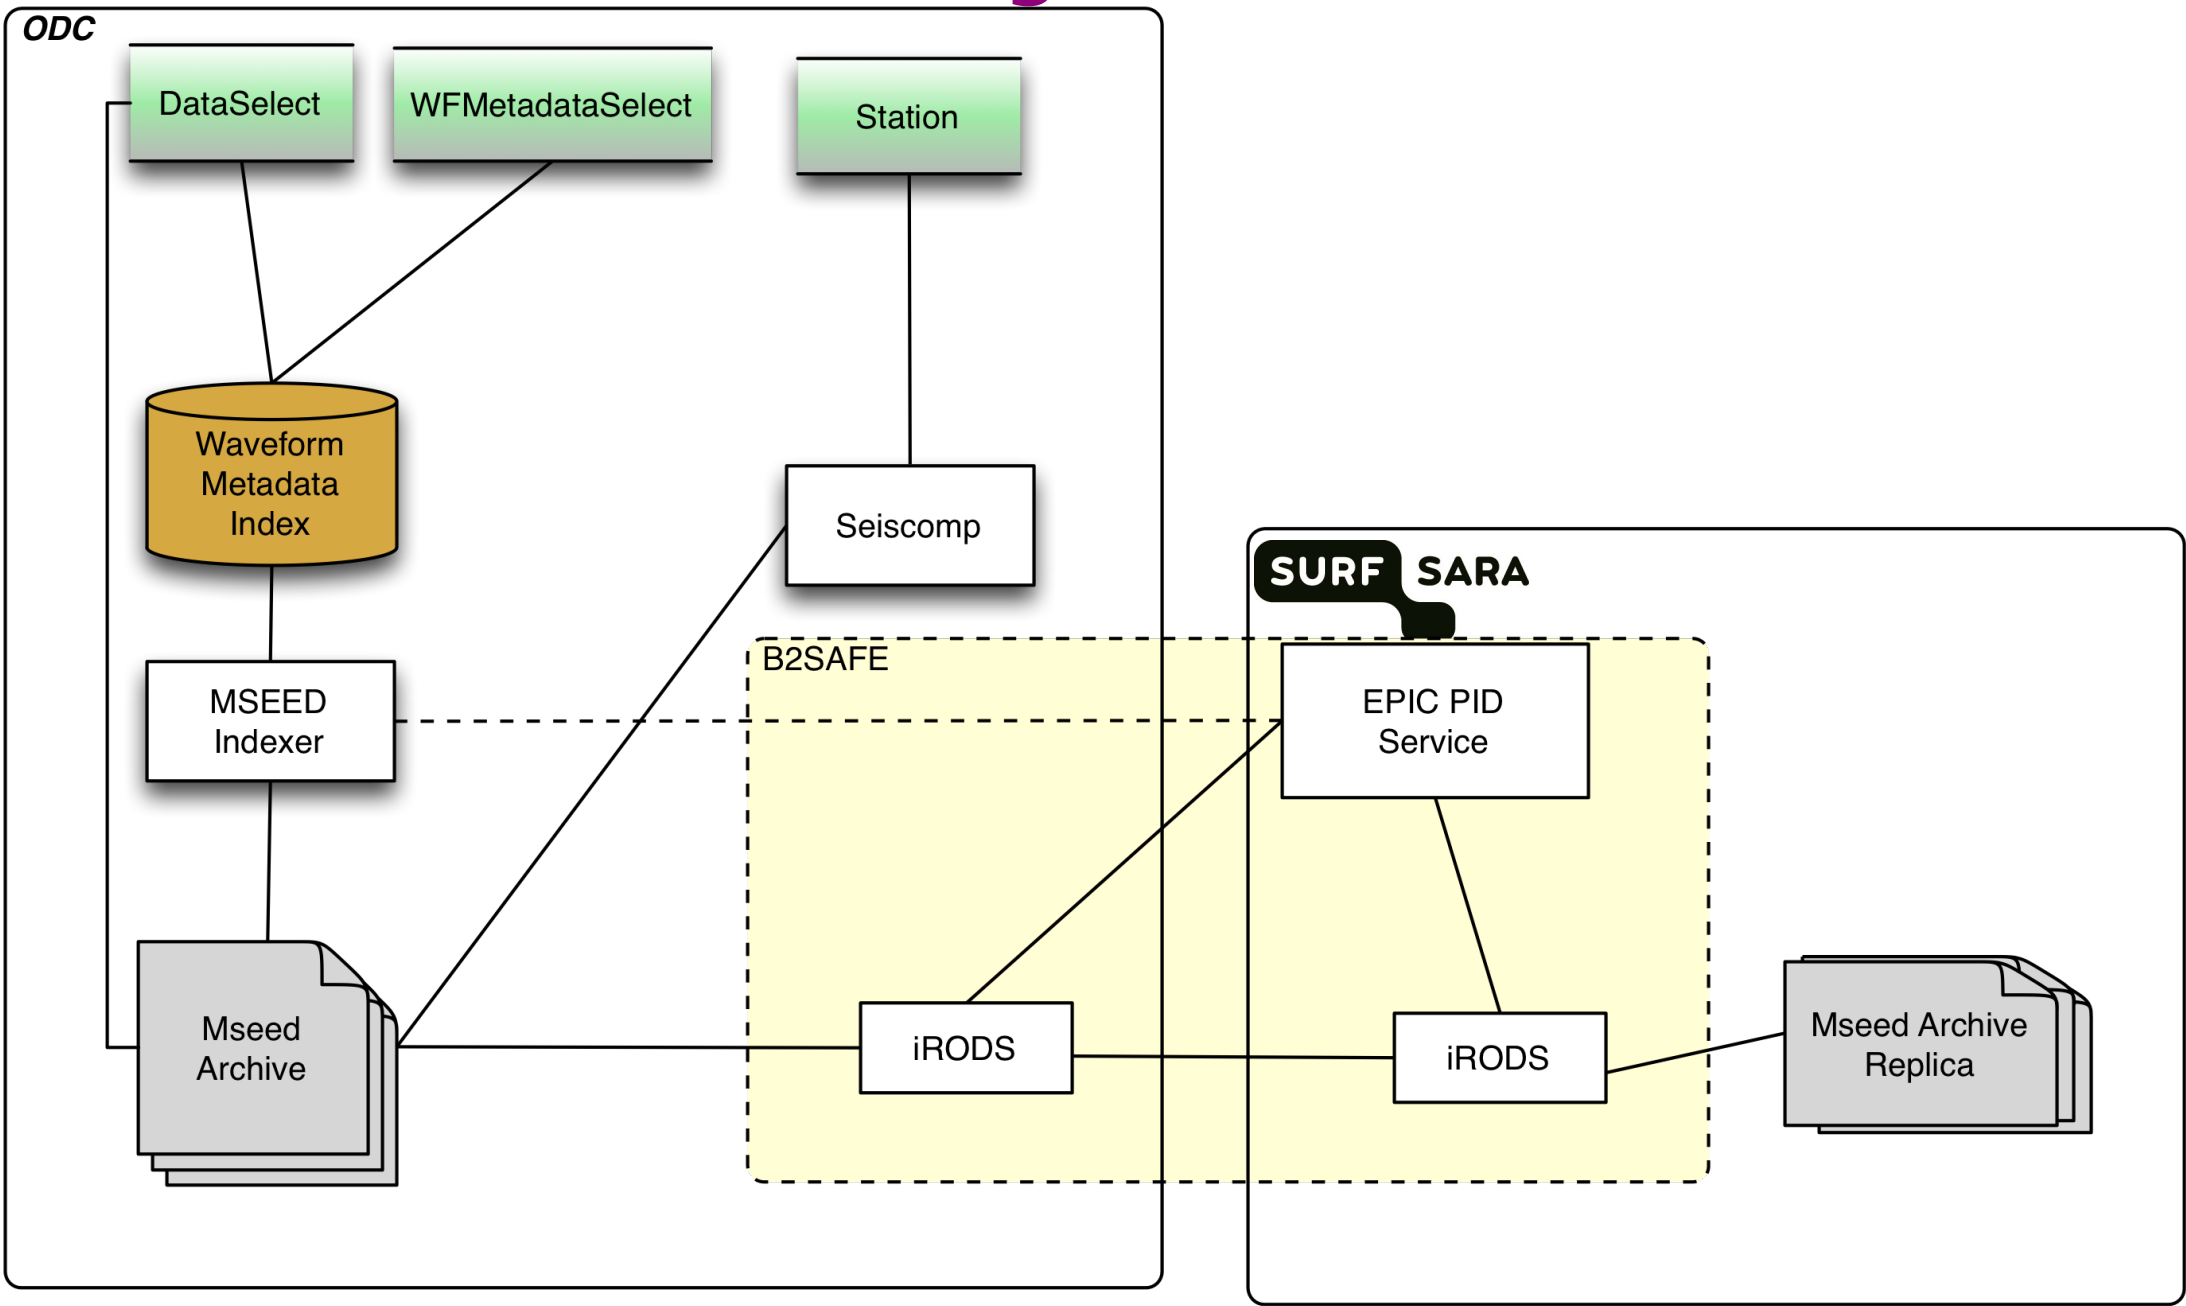

## Solution: current limitations

- PID assigned only to archived datasets: no real time yet  
Datasets are assumed as frozen at a certain point in time
- Replication applied to continuous waveforms but it could be extended also to other products. E.g.: stations, qc, ...
- PID granularity
- Replication mainly for backup purposes
- The current system does not support data provenance  
Impossible to trace the history of changes on a specific dataset: related to Dynamic Data
- PID not coupled with domain specific metadata

# ODC Metadata Integration

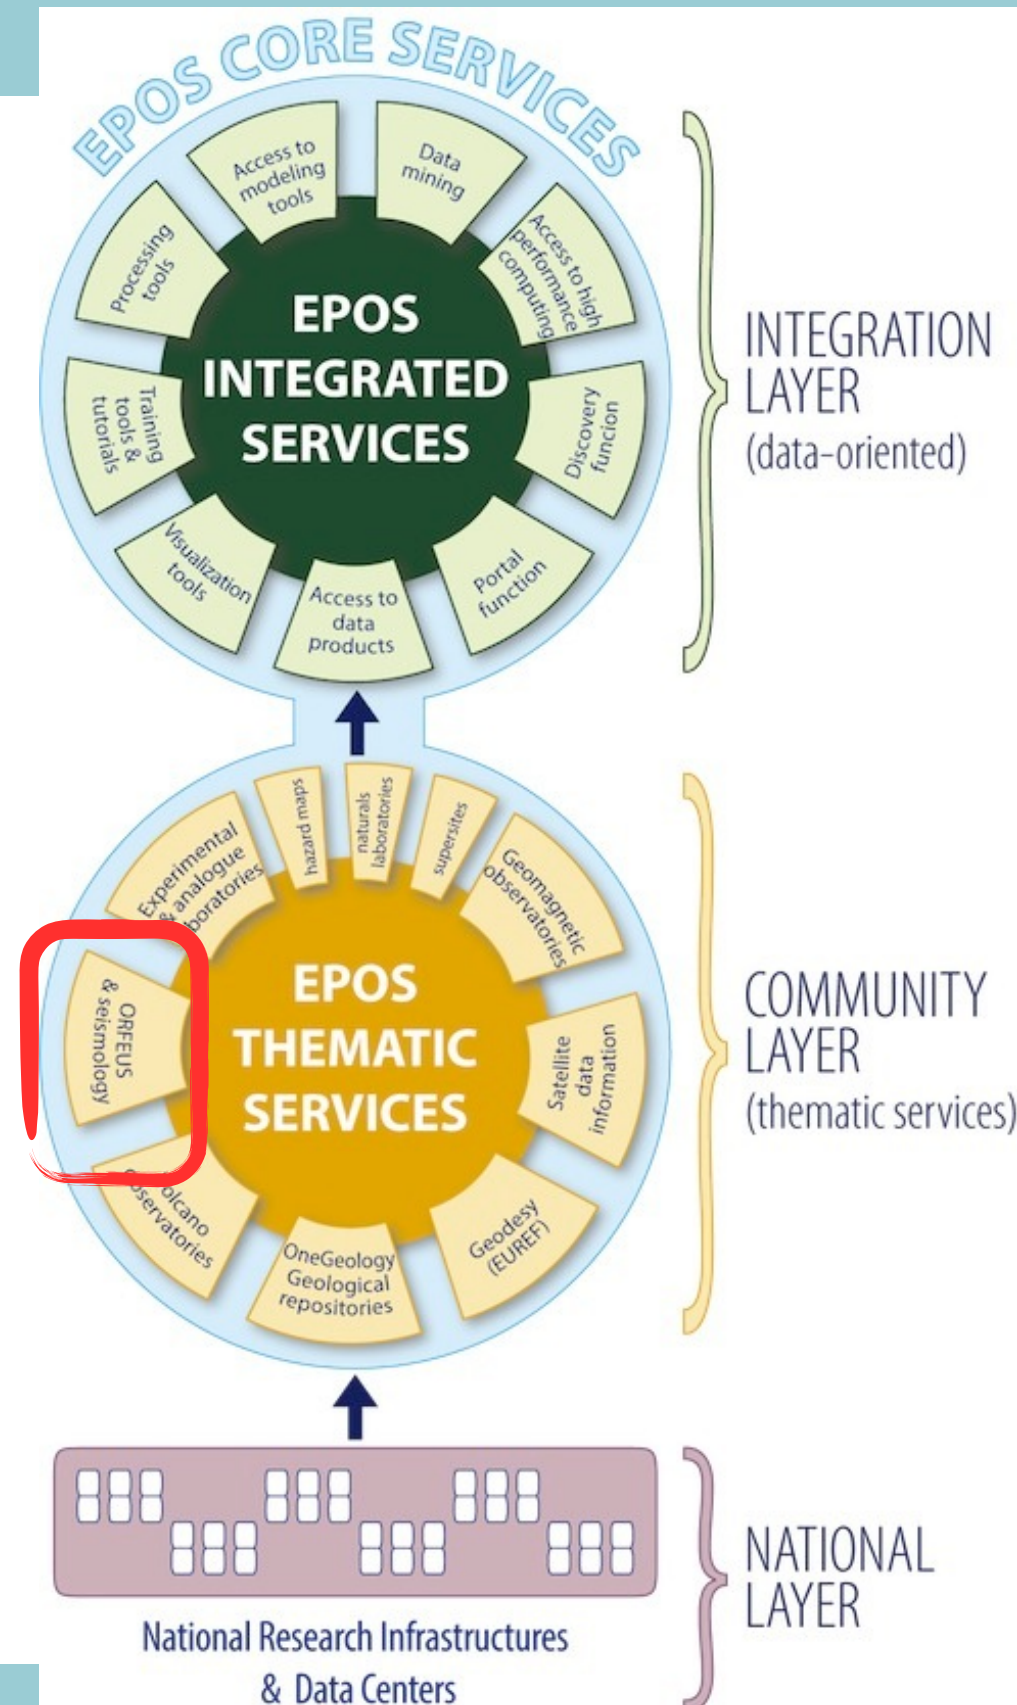

# EIDA and EPOS: EPOS-S

## European Plate Observing System

The existing national Research Infrastructures (RIs) for solid Earth science in Europe generate data and information and are responsible for the operation of instrumentation in each country. These RIs are integrated into the EPOS Thematic Services, which represent dedicated services for each specific community.

The distinct Thematic Services are further joined up to create the EPOS Integrated Services consisting of a variety of multidisciplinary services that will allow the access to data, data products, processing and visualisation tools and computational codes and resources for different stakeholders, not limited to the scientific community.

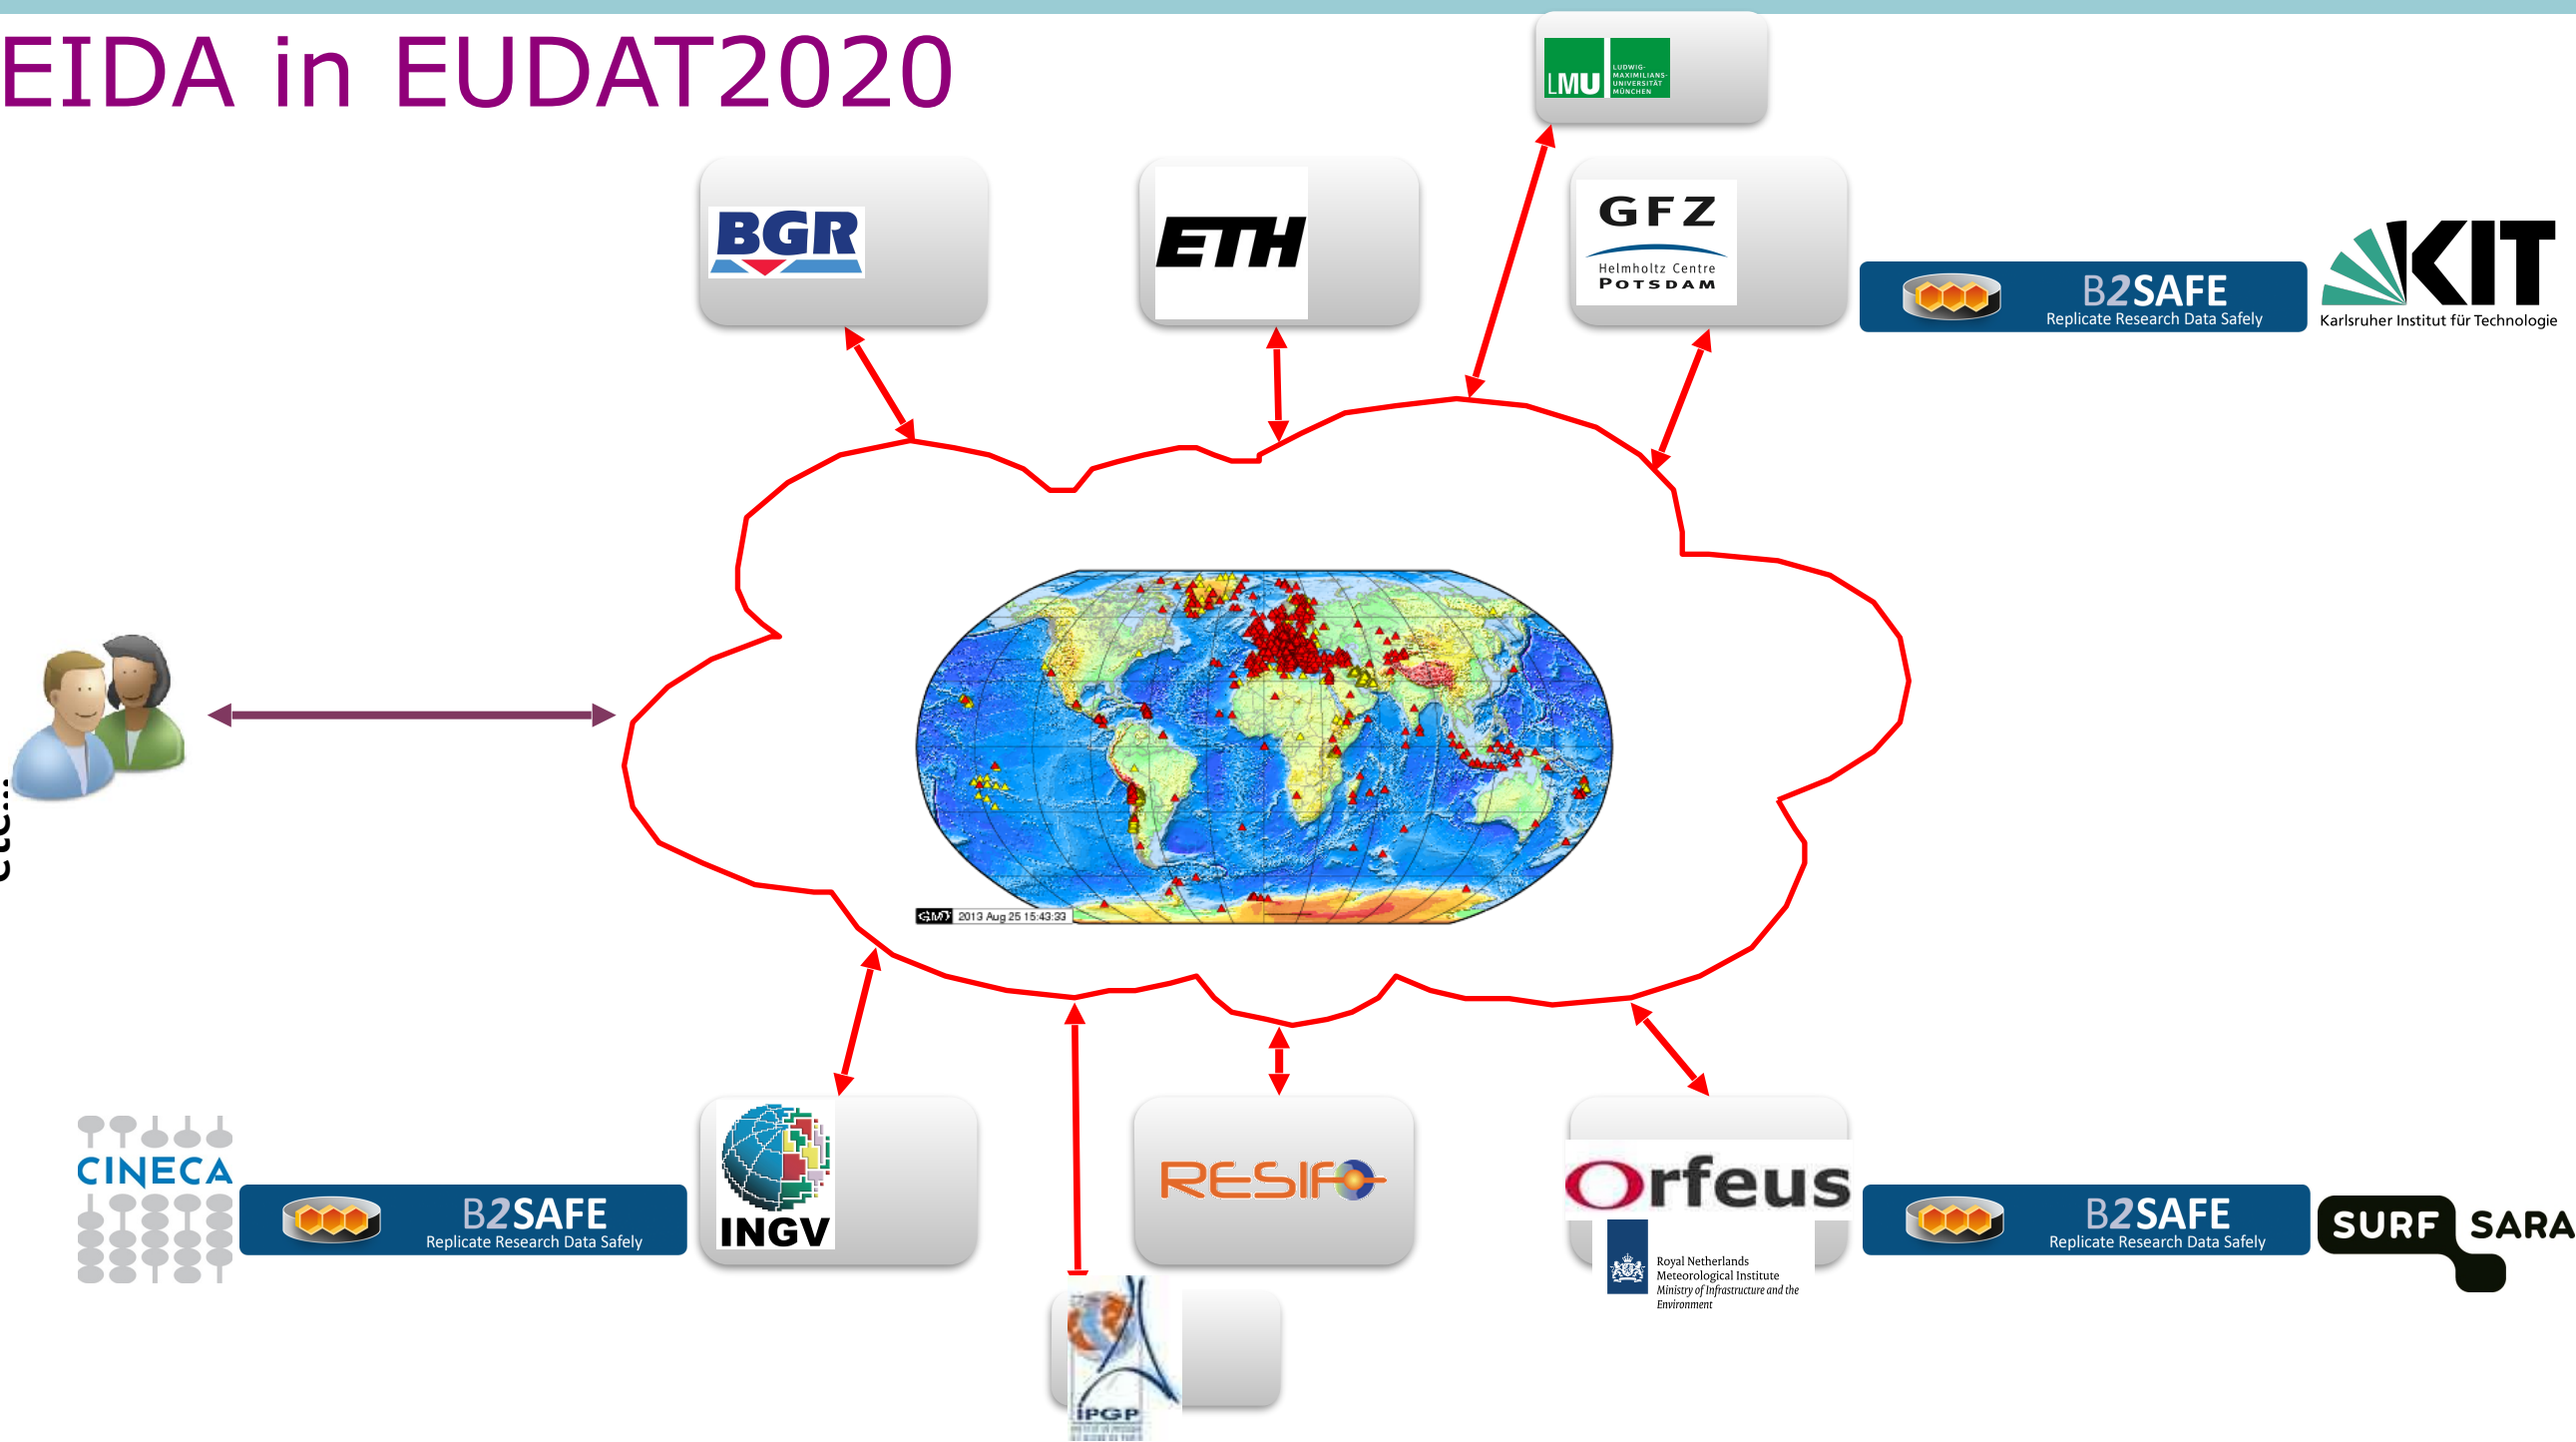

## EIDA/EPOS-S plans within EUDAT2020

- Set up a robust, scalable, reliable and secure infrastructure to support the federation of datacenters
- Enrich data streams with PIDs and detailed metadata
- Enable reproducibility and provenance
- Automatic safe replication of datasets on external data resources
- Effective exploitation of replicas: reliability, failover, disaster recovery, computation, optimisation
- Federated Discovery and Access
- Federated Identity Management (in discussion with eduGAIN/GEANT)

## European Integrated Data Archive (EIDA)

EIDA, an initiative within ORFEUS, is a distributed data centre established to (a) securely archive seismic waveform data and related metadata, gathered by European research infrastructures, and (b) provide transparent access to the archives by the geosciences research communities.

EIDA nodes are data centres which collect and archive data from seismic networks deploying broad-band sensors, short period sensors and accelerometers. Networks contributing data to EIDA are listed in the **ORFEUS EIDA networklist**. All data from the **VEBSN** at ORFEUS Data Center are available through EIDA.

Technically, EIDA is based on an underlying architecture developed by GFZ to provide transparent access to all nodes' data. Data within the distributed archives are accessible via the **ArcLink protocol**.

### EIDA data access

#### EIDA nodes and additional services/data:

Currently 8 nodes are contributing their data to EIDA. Six of them, called "primary nodes", have committed resources to ensure the EIDA operations and to support further developments. The region indicates the focus of operation for each node. Identical requests for open data to each EIDA nodes provide identical data. Each node may also provide unique, restricted data and additional services. Click on a node for detailed information on specific datasets and/or access tools.
